

## TM Agricultural

Tested for over a decade in numerous government and university research studies TM is proven to increase soil health.

TM Agricultural is used in all states of Australia and New Zealand. It is used in a wide range of agriculture, horticulture, and viticulture industries.

TM Agricultural is a soil ameliorant in a liquid form designed to kick start and increase beneficial biological activity in the soil. TM Agricultural is in a class of its own using "trigger" technology developed right from our own laboratories to activate the native biology in all soil types.

Soil biology is responsible for recycling nutrients, converting elements including phosphorus and atmospheric nitrogen into forms that are plant available and breaking down both man-made and natural toxins.

Common observations of TM Agricultural is loose aerated soil with high oxygen levels which means better water absorption and holding capacities and deeper root systems.

Healthy soils enable the inputs being used to be much more effective with greater efficiencies. Our goals at Best are to help you, the producer to grow healthy, high quality produce with reduced inputs, less risk and higher profits.

## Balance Crop Nutrients

TM Foliar is a product developed to meet crop nutrient requirements during growth. It is based on scientific research conducted on crops in different climates and soils around the world. This product has a balance of different nutrients in forms readily available to the plant.

TM Foliar helps plants absorb the required nutrients through the leaves when the product is sprayed on leaves. The combined influence of significantly higher nutrient absorption, and nutrients available in ready-to-absorb forms, gives the plants a balance of nutrients in the tissue, allowing for strong, healthy growth. As a result of this process, the overall crop quality and performance will be higher.

## Non-Toxic Ingredients

All the ingredients used in manufacturing TM Foliar are derived from reliable, non-toxic chemical and organic sources.

It can be used in the production of all commercial agricultural, horticultural and feed crops. The results are consistent when this product is used on different crops and soils, in different conditions and climates. However, the climate, crop and its management practices may have certain influence on overall performance.

## Easy To Apply

It is recommended that TM Foliar be applied on crops at the 4-to-5 leaf stage. It can be applied with most broad leaf control. A minimum of one application is required, but it can be applied more often, depending on the type of crop and its length of growing period. In greenhouses and on horticultural tree or fruit crops, it can be sprayed once every month until one month before the last harvest.

The product is available in liquid form in one and 10-litre containers. It can be safely mixed with most other fertilizers and herbicides while applying. Detailed directions on use and storage are given on the product label.
